

LANDSCAPE MITIGATION MEASURES

- 1 VMM 1 Site Selection**
 A detailed site selection process has been undertaken. One of the key considerations was to select a site that would the potential visual impacts associated with the Project.
- 2 VMM 2 Array Layout**
 The array of wind turbines shown in this study is preliminary only. There is an opportunity to amend the layout of the array to reduce the number of turbines visible for the most sensitive viewpoints. It must be noted that visual impacts are only one consideration when determining the layout of the array. Changes to the array are only possible when other technical details such as optimum sea floor and wind flow conditions are achievable.
- 3 VMM 3 Colours.**
 Appropriate colours for the wind turbines should be selected to reduce their visibility.
- 4 VMM 4 Blade Rotation.**
 To create a more harmonious visual pattern the blades for all turbines should rotate in the same direction.
