1 Introduction

The objective of this Sewerage Impact Assessment (SIA) is to assess the sewerage impact associated with the proposed Central Police Station Conservation and Revitalisation Project.

2 Project Outline and Description

The Central Police Station (CPS) Compound is a valuable heritage site and proposed to be revitalised to become a lively and integral part of the local community which will combine a dynamic arts, heritage and cultural offer with an independent and unique shopping and dining experience.

| | | |
|--------------------------|---|--|
| Project Title | : | Central Police Station Conservation and Revitalisation |
| Proponent | : | The Hong Kong Jockey Club Charities Trust |
| Nature and Description | : | Arts and Cultural Facilities with Retail Provision |
| Site Area | : | 14339m ² |
| Percentage of Paved Area | : | 100% (Existing) |
| Level to be filled up | : | Existing levels to be maintained |

3 Site Description

The location of the Site is shown in Figure 1. The Site is bounded by Hollywood Road to the north, Arbuthnot Road to the east, Chancery Lane to the south and Old Bailey Street to the west.

The Site comprises three Declared Monuments designated under the Antiquities and Monuments Ordinance in 1995. They are:

- Central Police Station located at platform level of approx.+45mPD;
- Central Magistracy located at platform level of approx. +45mPD; and
- Victoria Prison Compound located at platform level of approx. +50 to 55mPD.

4 Existing Sewerage System

With reference to DSD drainage record plan, the existing sewers in the vicinity of the Site comprising:

- An existing 225mm diameter sewer running along Hollywood Road with a 150mm diameter connection serving the lower site;
- An existing 225mm diameter sewer running along Arbuthnot Road and then connecting to the existing 225mm diameter sewer running along Hollywood Road;
- Existing 150mm diameter sewers running along Chancery Lane and connecting to the existing 225mm diameter sewers running along Arbuthnot Road and Old Bailey Street; and
- An existing 225mm diameter sewer running along Old Bailey Street with 150mm diameter connections serving the upper site and lower site respectively and then connecting to the existing 225mm diameter sewer along Hollywood Road.

A record of the existing sewerage system in the vicinity of the Site is shown in Figure 2.

5 Proposed Sewage Generation and Sewerage Impact

5.1 Predicted Sewage Generation

The estimate of sewage generation for the proposed development is estimated based on the proposed numbers of sanitary fitments to be installed as advised by our building services consultant and the Method of Discharge Units from Plumbing Engineering Services Design Guide 2002.

The sewage estimation for the proposed development is shown in Table B1 of Appendix B and summarized as Table 5.1 below.

Table 5.1 – Summary of Peak Flow Calculation

| Descriptions | Design Peak Flow (L/s) |
|----------------|------------------------|
| Lower Platform | 24.80 |
| Upper Platform | 25.45 |
| Total | 50.25 |

Due to the topographical arrangement of the existing historical buildings including the Central Police Station and Central Magistracy at the lower platform and the Victoria Prison at the upper platform, we proposed to maintain two existing sewerage connection points (FMH7031329 at Hollywood Road for lower

platform buildings and FMH7031357 at Old Bailey Street for upper platform buildings) for the project. Having considered the objective to avoid new sewer laying passing through the existing historical buildings and to minimize excavation works for new sewer laying adjacent to the existing historical buildings, we considered that maintaining at least two existing sewerage connection points are necessary.

Due to the absence of the as-built record for the existing sewerage system within the CPS, site investigation will be conducted to identify the existing sewerage arrangement and conditions during the detailed design stage. It is our intention to maintain two sewerage connection points for the project. However, the exact numbers and locations of sewerage connection points should be determined after completion of the site investigation including manholes inspection, CCTV survey etc for subsequent discussion and agreement with DSD and EPD during the detailed design stage.

The capacity calculation for the existing sewerage connection points using Colebrook-White Equation is shown in Table 5.2 below.

The existing sewerage connection points are adequate in capacities to intercept the peak sewage flows from the Site.

Table 5.2 – Capacity checking for the existing sewerage connection points

| Existing Sewer from DSD Record Plan (ks = 1.5mm) | | | | | | | |
|--|-----------------------------|----------------|------------|-------------|-------------|----------------|---------------------|
| Existing Upstream Manhole | Existing Downstream Manhole | Pipe Size (mm) | Length (m) | US IL (mPD) | DS IL (mPD) | Gradient (1:x) | Pipe Capacity (L/s) |
| FMH7031329 | FMH7031330 | 150 | 9.5 | 36.24 | 35.05 | 8 | 54.9 |
| FMH7031330 | FMH7031331 | 150 | 5.0 | 35.05 | 34.43 | 8 | 54.9 |
| FMH7031357 | Existing 225mm sewer | 150 | 5 | 47.30 | 46.55 | 7 | 58.7 |

5.2 Capacity Checking of Existing Public Sewers

In order to assess the impact on the existing sewers associated with the development, the software “HydroWorks” was used for hydraulic analysis of the existing public sewers.

The estimation of sewage generation in the vicinity of the Site is based on the assumptions as below:

- 1) The projected population (2016) as based on the latest Territorial Population and Employment Data Matrix (TPEDM) 2006;
- 2) Flow factor for projected population is assumed to be 370L/person/day as per DSD Sewerage Manual Table 2;
- 3) Global peaking factor with stormwater allowance is adopted as per DSD Sewerage Manual Table 3.

The projected population (2016) and the resulted sewage estimation are shown in Table B2, B3 and Figure 4 of Appendix B.

The hydraulic performance of the existing sewers under design flows of 2016 is shown in the HydroWorks results in Appendix B and summarised in Table 5.3 as follows.

1. The predicted hydraulic gradeline level for the existing sewer is below the soffit level of the sewer except at the existing pipes (between Manhole FMH7029914 to FMH7031327) along Hollywood Road.
2. There is no flooding under the peak flow condition because sufficient freeboard of over 300mm is allowed in the sewers.

Table 5.3 – Freeboard at Various Sewerage Manhole Locations

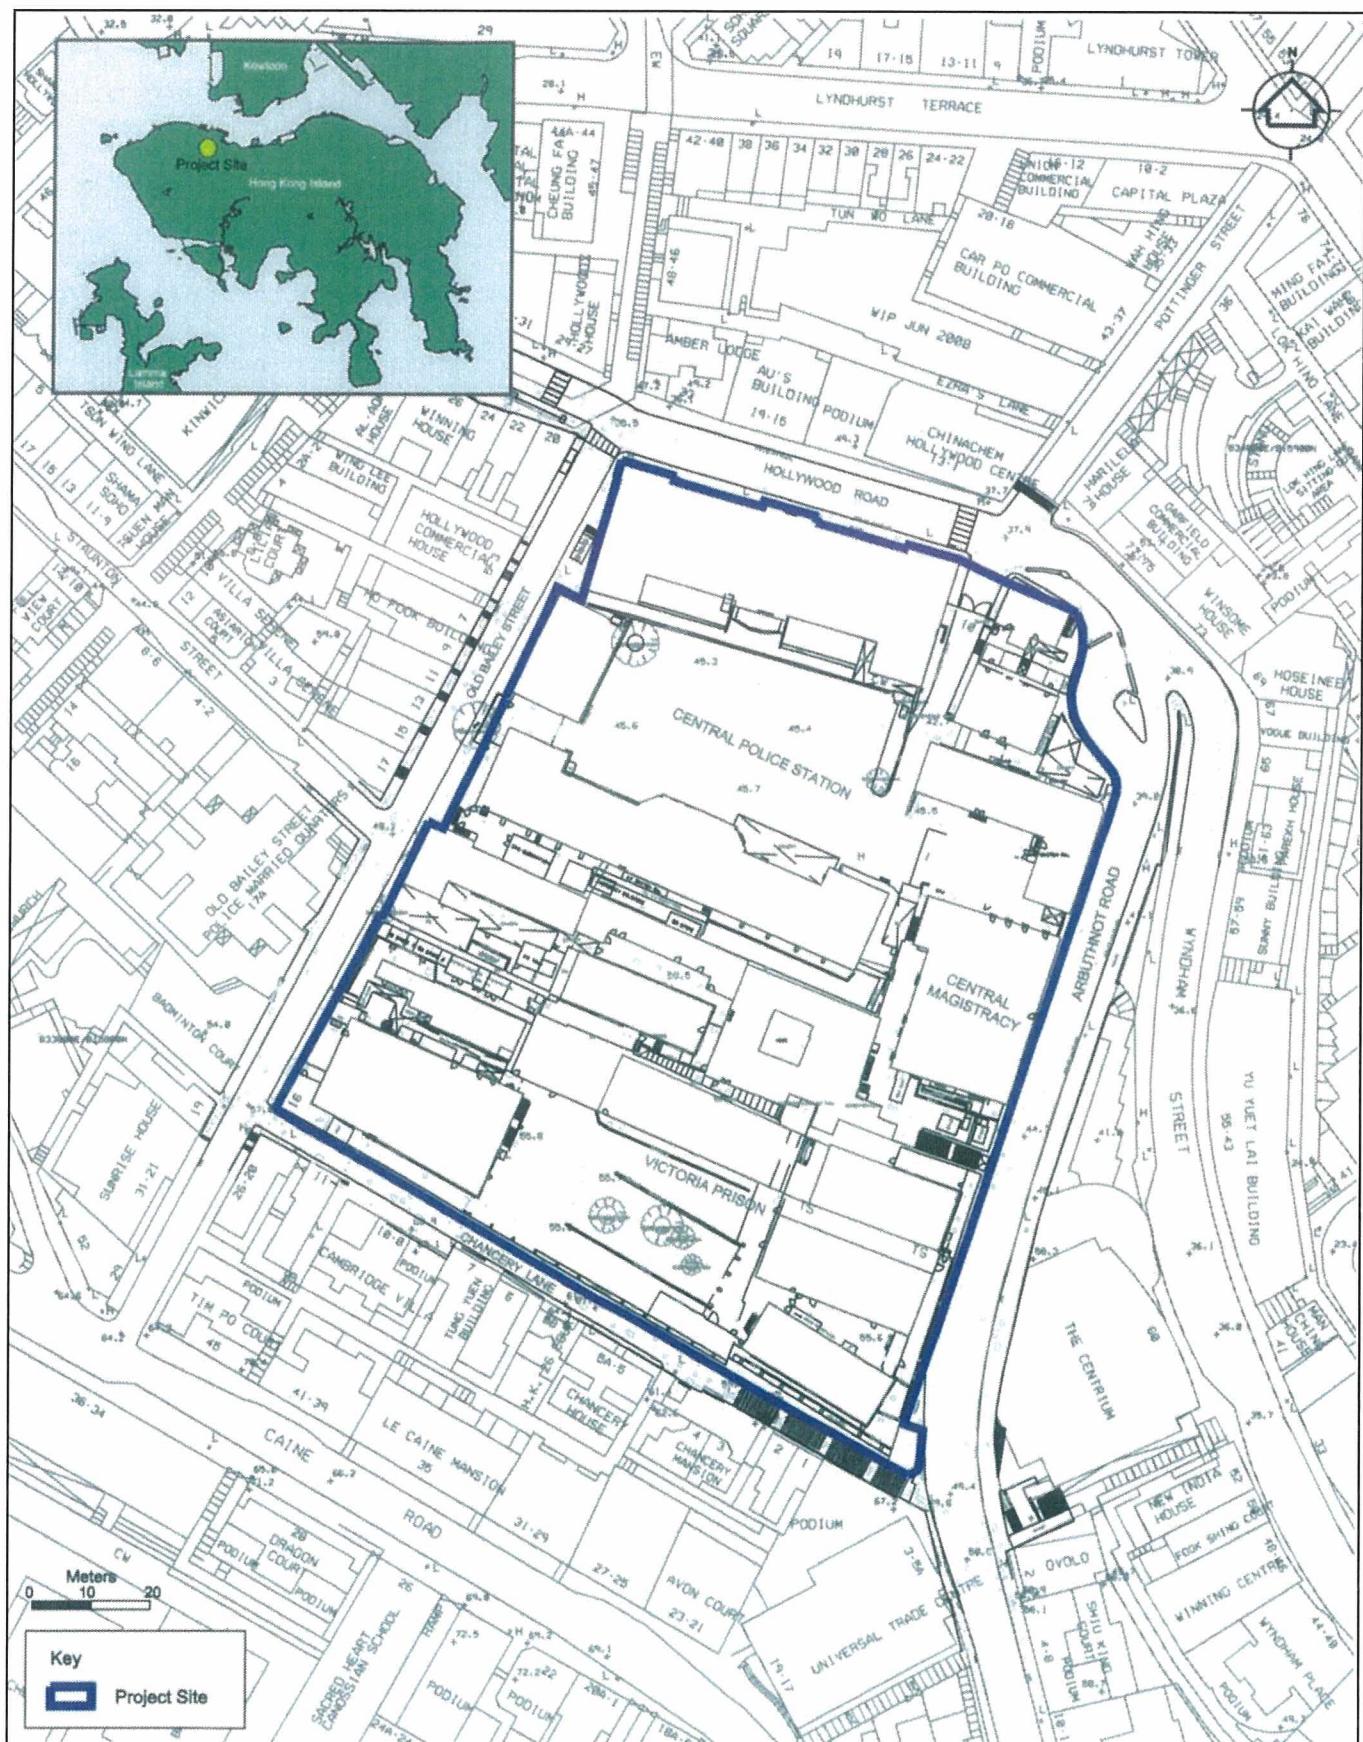

| Node Reference | Ground Level (m AD) | Max Level (m AD) | Free-board (m) | Node Reference | Ground Level (m AD) | Max Level (m AD) | Free-board (m) |
|----------------|---------------------|------------------|----------------|----------------|---------------------|------------------|----------------|

| FMH7041286 | 60.59 | 58.59 | 2.00 | FMH7031340 | 58.69 | 57.60 | 1.09 |
| FMH7041309 | 61.41 | 59.03 | 2.38 | FMH7031339 | 61.09 | 60.20 | 0.89 |
| FMH7031368 | 62.97 | 61.67 | 1.30 | FMH7031448 | 61.1 | 60.38 | 0.72 |

6 Conclusion

The proposed development will generate a peak flow of 50.25L/s. The hydraulic analysis concluded that there is sufficient freeboard allowed in the existing 225mm diameter public sewers along Hollywood Road, Old Bailey Road and Arbuthnot Road and no improvement to the existing public sewer is required as a result of the proposed development. Thus no adverse sewerage impact is anticipated to be resulted from the Project.

Calculation

Project : Central Police Station Compound Conservation and Revitalization**Table B1 - Estimation of Sewage Discharge Flow (Based on Sanitary Fittings and Method of Discharge Unit)****1) The peak design flow is assessed by applying a frequency of use K factor to the total sum of the discharge units and by using the following equation.**

$$\text{Peak Design Flow } Q = K \cdot v \sum \text{DU} \quad (\text{From Plumbing Engineering Services Design Guide 2002})$$

Where

Q = Peak Design Flow (l/s)

K = Frequency of use = 1.0 (From Table 6 of Plumbing Engineering Services Design Guide 2002 for Congested Usage)

ΣDU = Sum of discharge units (From Table 5 of Plumbing Engineering Services Design Guide 2002)

The preliminary estimation of sewage discharge flow and schedule of sanitary fitment for each buildings are listed below.

2) Schedule of Sanitary Fitment and Estimation of Peak Design Flow

| Location | Level/Total No. of Sanitary Fitment | W.C. | Wash Hand Basin | Urinal | Sink | Cleansing Point | Remark |
|--|--|------------------|------------------|------------------|---------------|-----------------|--|

+ after total flow indicates a pipe/channel surcharged by flow and depth at that end.
x after total flow indicates a pipe/channel surcharged by depth only at that end.

NOTE :

- (i) maximum elevations, depths, volumes, velocities and discharges are selected from the values at each time increment and will be in general more extreme than the maximum values in the hydrograph files.
- (ii) maximum elevations, velocities and discharges are not necessarily calculated at the same time.
- (iii) max. velocity is not calculated for a pipe if either the water level does not exceed 5% of the pipe depth or the discharge is less than 0.001 m³/s.
